

Multi-Earner Families

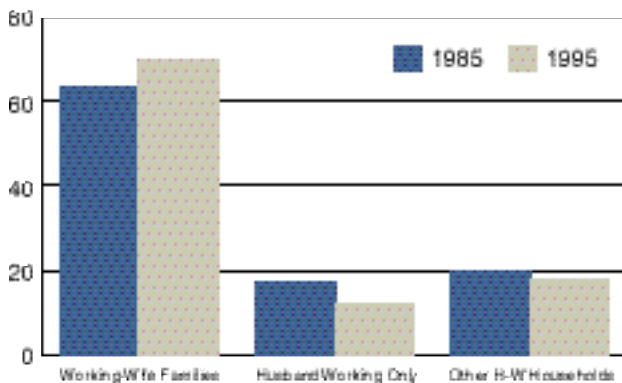

June 1998

% of Married Couple Households

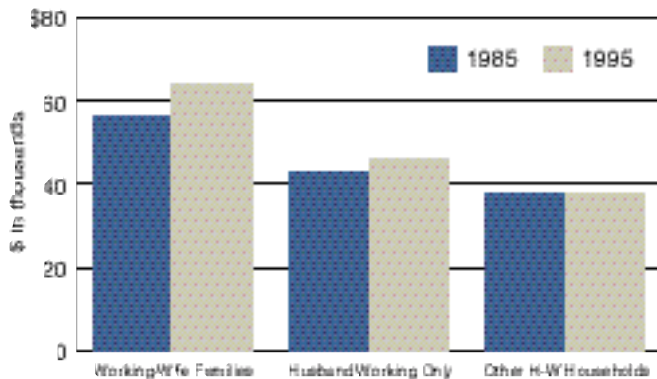

There are almost 54 million married-couple households in the United States, an increase of about 3.5 million since 1985. During this period, the fastest growing sector has been the dual-earner household: Homes in which both the husband and wife are employed climbed from 21 million to almost 25 million, an increase of roughly 20 percent. Homes in which the husband is the sole income provider have declined significantly, however, from about 10 million in 1985 to approximately 8 million a decade later. As a result, their relative importance dropped from 19 percent to 14 percent. While the number of households in which both spouses are no longer active in the labor force rose moderately, from about 13 million to 14 million, there was no large increase in their relative importance.

% of Married Couple Income

Married-couple families have close to \$3 trillion at their disposal, up from nearly \$2.5 trillion in 1985. Dual-earner homes account for about \$1.5 trillion, or more than half of the aggregate. Over the past decade, this segment of the population has experienced income growth of about 40 percent. On the other hand, multi-paycheck households currently have at their disposal \$535 billion, a growth rate of less than 14 percent. Over the same time span, however, homes in which the husband is the sole wage earner, as well as non-working couple households, have both experienced a sharp decrease in total income.

Average Income (Constant 1994 Dollars)

Married-couple households earn about \$54,500 annually, an increase of less than 12 percent over the past decade. Not all segments of the population have fared the same, however, with dual-earner households experiencing the most dramatic increase in their earning power. While in 1985 they earned less than \$52,000, their current average earnings top \$60,000, an advance of more than 17 percent. During the same period, multi-paycheck household earnings climbed from about \$69,000 to \$75,000, an increase of almost 9 percent. Similarly, single-earner households posted an 8 percent increase, from close to \$43,000 to more than \$46,000 a decade later. In contrast, average household income of retired couples declined negligibly, averaging about \$38,000.

Highlights . . .

Currently, there are close to 100 million households in the United States. Married-couple homes account for roughly 54 million, or slightly more than half of all households. While aggregate income exceeds \$4 trillion, married-couple homes account for just under \$3 trillion, or 70 percent of total household income.

Among husband-wife families, there are significant differences in their demographic, economic, and social composition. Several key highlights follow:

Dual-Earner Households

- Dual-income earners, who are, on average, younger than multi- and single-income families, account for about 25 million households. About 35 percent of householders are under age 35, and another 52 percent are between the ages of 35 and 54. The remaining 13 percent are over age 55.
- Dual-earner households account for more than half of the nearly \$3 trillion in household income flowing to married-couple homes. Of this amount, less than 28 percent flows to householders under age 35, approximately 58 percent accrues to householders between the ages of 35 and 54, and the remaining 14-plus percent is accounted for by householders who are 55 and over.
- About 12 percent of dual-earner households are in the low end of the earnings scale, with annual incomes of less than \$25,000, while almost 36 percent earn between \$25,000 and \$50,000. However, a majority of householders are financially well-off: Close to 30 percent of dual-income families fall into the \$50,000-to-\$75,000 income bracket, while an additional 24 percent have earnings that exceed \$75,000.
- Close to 60 percent of dual-income homes have some children present. In about 17 percent of these households, the offspring

are under the age of 6, while in about 14 percent there are both pre-schoolers and children aged 6 to 17 present. The remaining 27 percent of homes consist of only school-age children (6 to 17 years).

- Dual-earner householders tend to have a high level of education. More than 30 percent have earned at least a college degree, of which 12 percent hold an even more advanced graduate degree.

Multi-Earner Households

- Multi-earner households have at their disposal in excess of \$535 billion. About 78 percent of these dollars flow to homes in the 35 to 55 age group, roughly 18 percent belong to householders over age 55, and a mere 4 percent to those under age 35.
- As expected, these households are the more affluent ones; the vast majority comprises the upper end of the income scale. Close to 33 percent fall into the \$50,000-to-\$75,000 income bracket, and an additional 40 percent earn in excess of \$75,000. About 23 percent have earnings in the range of \$25,000 to \$50,000, and less than 5 percent earn under \$25,000 per year.
- Here, too, nearly 60 percent of the households have children present. The percentage of homes in which children only under the age of 6 are present, however, is significantly lower than in dual-income homes: less than 5 percent versus 17 percent. The overwhelming majority of these households, 47 percent, contain children between the ages of 6 and 17.
- Multi-income households also tend to be better educated than other householders. Nearly 28 percent of householders have earned at least a college degree, while about one-third of this college-educated segment has also earned a post-graduate degree.

Single-Earner Households

- Single-earner households, homes in which the husband is the sole income source, number about 8 million, and their age distribution tends to differ somewhat from their dual- and multi-earner counterparts. About 45 percent are between the ages of 35 and 55. Another 30 percent are over age 55, and some 25 percent are under age 35.

About the Tables

Table I shows the percent distribution of total households. Table II shows the percent distribution of total household income. Each table provides information by selected demographic and social characteristics. The number of homes and the amount of income in each cell can be derived by applying the corresponding percentages to the "Total" figures shown on the top line of the relevant table.

Table III shows average household income and Table IV shows per capita income. Household size can be derived by dividing average household income by per capita income. The total number of people in each cell can be derived by multiplying total households by average size.

All the data in this publication are based on a survey conducted by the U.S. Bureau of the Census in 1995.

Highlights	2
Summary Table	3
Household Distribution	4
Income Distribution	6
Average Income	8
Per Capita Income	10

- A rather large percentage of these householders earn modest incomes. About 33 percent have annual earnings of less than \$25,000, while an additional 36 percent earns between \$25,000 and \$50,000. The remaining 31 percent of households earn in excess of \$50,000, with earnings more or less evenly distributed between the \$50,000-to-\$75,000 income bracket and the \$75,000-and-over income bracket.
 - As with working-couple families, close to 60 percent of single-earner households have children present. A substantial number of these families, 18 percent, have only children under the age of 6 present; about an equal proportion of households have both toddlers and school-age youngsters present. Homes with children who are all of school age (6 to 17 years) comprise about one-third of the total.
 - Single-income households are as well educated as their dual- and multi-earner counterparts. Close to 30 percent have earned at least a college degree, with more than one-third also possessing an advanced degree.
- Other Households**
- There are an estimated 14 million households in which neither the husband nor the wife is in the labor force, with the overwhelming majority composed of retired persons. Not surprisingly, more than 70 percent of these householders are over age 55. A much smaller percentage, 22 percent, is between the ages of 35 and 55, and the remaining 7 percent are under age 35.
 - As expected, a significant proportion of these households, approximately 45 percent, has annual earnings of less than \$25,000. An additional 33 percent falls within the \$25,000-to-\$50,000 income category. The remaining 22 percent have earnings that are in excess of \$50,000.
 - Less than 25 percent of the “other” households have children present. And, in the vast majority of these homes, the children are of school age (6 to 17).
 - The level of educational attainment among these non-working couples runs somewhat below that of their working counterparts. Slightly more than 17 percent have earned a college diploma, and about one-third of these graduates have also obtained a post-graduate degree.
