

**THE CONFERENCE BOARD**

Brussels    Copenhagen    Frankfurt    Hong Kong    London    Mexico City    New Delhi    Ottawa  
New York    Chicago    San Francisco    Washington

**FOR RELEASE: 10:00 A.M. ET, THURSDAY, JULY 19, 2007**

The Conference Board® U.S. Business Cycle Indicators<sup>SM</sup>  
**U.S. LEADING ECONOMIC INDICATORS**  
**AND RELATED COMPOSITE INDEXES FOR JUNE 2007**

The Conference Board announced today that the U.S. leading index decreased 0.3 percent, the coincident index increased 0.2 percent and the lagging index increased 0.5 percent in June.

- The leading index decreased in June after increasing in May, and it has declined in four of the last six months. Housing permits made the largest negative contribution to the leading index in June, followed by initial claims for unemployment insurance (inverted) and consumer expectations. The leading index declined 0.7 percent from December to June (a -1.3 percent annual rate).
- The coincident index increased again in June. From December to June, the coincident index rose by 0.6 percent (a 1.3 percent annual rate). In June, industrial production made the largest positive contribution followed by personal income less transfer payments\* and employment. The strengths among the coincident indicators have been very widespread in recent months despite a slow down in its growth rate from an average annual rate of about 2.5 percent in 2006.
- The leading index has been fluctuating around an essentially flat trend since January, and the number of decreasing components has been slightly more than the number of components increasing in recent months. At the same time, real GDP grew only at a 0.7 percent annual rate in the first quarter of 2007, slowing down from a 2.5 percent rate in the fourth quarter of 2006. The performance of the leading index so far in the first half of 2007 continued to be mixed with offsetting increases and decreases, and suggests that economic growth is likely to continue, but it is likely to be at a slow pace in the near term.

**LEADING INDICATORS.** Three of the ten indicators that make up the leading index increased in June. The positive contributors – beginning with the largest positive contributor – were average weekly manufacturing hours, manufacturers’ new orders for nondefense capital goods\*, and stock prices. The negative contributors – beginning with the largest negative contributor – were building permits, average weekly initial claims for unemployment insurance (inverted), index of consumer expectations, vendor performance, and interest rate spread. The manufacturers’ new orders for consumer goods and materials\* and real money supply\* held steady in June.

The leading index now stands at 137.5 (1996=100). Based on revised data, this index increased 0.2 percent in May and decreased 0.2 percent in April. During the six-month span through June, the leading index decreased 0.7 percent, with four out of ten components advancing (diffusion index, six-month span equals forty percent).

The next release is scheduled for August 20, Monday at 10 A.M. ET.

COINCIDENT INDICATORS. All four indicators that make up the coincident index increased in June. The positive contributors to the index – beginning with the largest positive contributor – were industrial production, personal income less transfer payments\*, employees on nonagricultural payrolls, and manufacturing and trade sales\*.

The coincident index now stands at 124.2 (1996=100). This index increased 0.1 percent in May and increased 0.2 percent in April. During the six-month period through June, the coincident index increased 0.6 percent.

LAGGING INDICATORS. The lagging index stands at 129.2 (1996=100) in June, with one of the seven components advancing. The positive contributor to the index was commercial and industrial loans outstanding\*. The negative contributors – beginning with the largest negative contributor – were change in labor cost per unit of output\*, average duration of unemployment (inverted), and change in CPI for services. The ratio of manufacturing and trade inventories to sales\*, average prime rate charged by banks, and ratio of consumer installment credit to personal income\* held steady in June. Based on revised data, the lagging index increased 0.3 percent in May and increased 0.2 percent in April.

#### DATA AVAILABILITY AND NOTES.

The data series used by The Conference Board to compute the three composite indexes and reported in the tables in this release are those available “as of” 12 Noon on July 18, 2007. Some series are estimated as noted below.

\* Series in the leading index that are based on The Conference Board estimates are manufacturers’ new orders for consumer goods and materials, manufacturers’ new orders for nondefense capital goods, and the personal consumption expenditure used to deflate the money supply. Series in the coincident index that are based on The Conference Board estimates are personal income less transfer payments and manufacturing and trade sales. Series in the lagging index that are based on The Conference Board estimates are inventories to sales ratio, consumer installment credit to income ratio, change in labor cost per unit of output, the consumer price index, and the personal consumption expenditure used to deflate commercial and industrial loans outstanding.

The procedure used to estimate the current month’s personal consumption expenditure deflator (used in the calculation of real money supply and commercial and industrial loans outstanding) now incorporates the current month’s consumer price index when it is available before the release of the U.S. Leading Economic Indicators.

Effective with the September 18, 2003 release, the method for calculating manufacturers’ new orders for consumer goods and materials (A0M008) and manufacturers’ new orders for nondefense capital goods (A0M027) has been revised. Both series are now constructed by deflating nominal aggregate new orders data instead of aggregating deflated industry level new orders data. Both the new and the old methods utilize appropriate producer price indices. This simplification remedies several issues raised by the recent conversion of industry data to the North American Classification System (NAICS), as well as several other issues, e.g. the treatment of semiconductor orders. While this simplification caused a slight shift in the levels of both new orders series, the growth rates were essentially the same. As a result, this simplification had no significant effect on the leading index.

THE CYCLICAL INDICATOR APPROACH. The composite indexes are the key elements in an analytic system designed to signal peaks and troughs in the business cycle. The leading, coincident, and lagging indexes are essentially composite averages of between four and ten individual leading, coincident, or lagging indicators. (See page 3 for details.) They are constructed to summarize and reveal common turning point patterns in economic data in a clearer and more convincing manner than any individual component—primarily because they smooth out some of the volatility of individual components.

Historically, the cyclical turning points in the leading index have occurred before those in aggregate economic activity, while the cyclical turning points in the coincident index have occurred at about the same time as those in aggregate economic activity. The cyclical turning points in the lagging index generally have occurred after those in aggregate economic activity.

U.S. Composite Indexes: Components and Standardization Factors

<u>Leading Index</u>		<u>Factor</u>
1	Average weekly hours, manufacturing	0.2565
2	Average weekly initial claims for unemployment insurance	0.0310
3	Manufacturers' new orders, consumer goods and materials	0.0763
4	Vendor performance, slower deliveries diffusion index	0.0672
5	Manufacturers' new orders, nondefense capital goods	0.0186
6	Building permits, new private housing units	0.0270
7	Stock prices, 500 common stocks	0.0384
8	Money supply, M2	0.3530
9	Interest rate spread, 10-year Treasury bonds less federal funds	0.1037
10	Index of consumer expectations	0.0283
<u>Coincident Index</u>		
1	Employees on nonagricultural payrolls	0.5411
2	Personal income less transfer payments	0.1908
3	Industrial production	0.1491
4	Manufacturing and trade sales	0.1190
<u>Lagging Index</u>		
1	Average duration of unemployment	0.0374
2	Inventories to sales ratio, manufacturing and trade	0.1235
3	Labor cost per unit of output, manufacturing	0.0624
4	Average prime rate	0.2808
5	Commercial and industrial loans	0.1113
6	Consumer installment credit to personal income ratio	0.1891
7	Consumer price index for services	0.1955

Notes:

The component factors are inversely related to the standard deviation of the month-to-month changes in each component. They are used to equalize the volatility of the contribution from each component and are “normalized” to sum to 1. When one or more components are missing, the other factors are adjusted proportionately to ensure that the total continues to sum to 1.

These factors were revised effective on the release for January 2007, and all historical values for the three composite indexes were revised at this time to reflect the changes. (Under normal circumstances, updates to the leading, coincident, and lagging indexes only incorporate revisions to data over the past six months.) The factors for the leading index were calculated using 1984-2005 as the sample period for measuring volatility. A separate set of factors for the 1959-1983 period is available upon request. The primary sample period for the coincident and lagging indexes was 1959-2005. For additional information on the standardization factors and the index methodology see: “Benchmark Revisions in the Composite Indexes,” *Business Cycle Indicators* December 1997 and “Technical Appendix: Calculating the Composite Indexes” *Business Cycle Indicators* December 1996, or the Web site: [www.conference-board.org/economics/bci](http://www.conference-board.org/economics/bci).

The trend adjustment factor for the leading index is -0.0188, and the trend adjustment factor for the lagging index is 0.1714.

To address the problem of lags in available data, those leading, coincident and lagging indicators that are not available at the time of publication are estimated using statistical imputation. An autoregressive model is used to estimate each unavailable component. The resulting indexes are therefore constructed using real and estimated data, and will be revised as the unavailable data during the time of publication become available. Such revisions are part of the monthly data revisions, now a regular part of the U.S. Business Cycle Indicators program. The main advantage of this procedure is to utilize in the leading index data such as stock prices, interest rate spread, and manufacturing hours that are available sooner than other data on real aspects of the economy such as manufacturers’ new orders. Empirical research by The Conference Board suggests that there are real gains in adopting this procedure to make all the indicator series as up-to-date as possible.

**U.S. Leading Economic Indicators news release schedule for 2007:**

Monday, August 20, 2007	for July 2007 data
Thursday, September 20, 2007	for August 2007 data
Thursday, October 18, 2007	for September 2007 data
Wednesday, November 21, 2007	for October 2007 data
Thursday, December 20, 2007	for November 2007 data

All releases are at 10:00 AM ET.

ABOUT THE CONFERENCE BOARD. The Conference Board is the premier business membership and research network founded in 1916. It has become a global leader in helping executives build strong professional relationships, expand their business knowledge and find solutions to a wide range of business challenges. Its Economics Program, under the direction of Chief Economist Gail Fosler, is a recognized source of forecasts, analysis and objective indicators such as Leading Economic Indicators and Consumer Confidence.

This role is part of a long tradition of research and education that stretches back to the compilation of the first continuous measure of the cost of living in the United States in 1919. In 1995, The Conference Board assumed responsibility for computing the composite indexes from the U.S. Department of Commerce. The Conference Board now produces business cycle indexes for the U.S., Australia, France, Germany, Korea, Japan, Mexico, Spain and the U.K. To subscribe to any of these indexes, please visit [www.conference-board.org/economics/bci](http://www.conference-board.org/economics/bci) or contact the customer service department at 212-339-0345 or email [indicators@conference-board.org](mailto:indicators@conference-board.org).

AVAILABLE FROM THE CONFERENCE BOARD

U.S. Business Cycle Indicators Internet Subscription <i>(Includes monthly release, data, charts and commentary)</i>	\$ 575 per year (1 user)
Individual Data Series	\$ 30 per series downloaded
Monthly BCI Report <i>(Sample available on request)</i>	\$ 250 per year
BCI Handbook (published 2001)	\$ 20
Corporate Site License	contact Indicators Program at (212) 339-0330

Business Cycle Indicators for Australia, France, Germany, Japan, Korea, Mexico, Spain and the UK are available at \$575 per country per year (1 user). Discounts are available to Associates of The Conference Board and accredited academic institutions.

Coincident index								
Percent change	1.1	.9	.8	.9	.7	.8	.6	
Diffusion index	100.0	75.0 r	62.5	100.0	100.0	100.0	100.0	
Lagging index								
Percent change	1.9	2.3	2.6	2.1	1.9	1.5	1.2	
Diffusion index	85.7	78.6	78.6	35.7	50.0	50.0	35.7	

p Preliminary. r Revised (noted only for index levels and one-month percent changes). c Corrected.

CALCULATION NOTE: The diffusion indexes measure the proportion of the components that are rising. Components that rise more than 0.05 percent are given a value of 1.0, components that change less than 0.05 percent are given a value of 0.5, and components that fall more than 0.05 percent are given a value of 0.0.

The full history of composite and diffusion indexes is available by subscription on our web site at [www.conference-board.org/economics/bci](http://www.conference-board.org/economics/bci)
