

FOR RELEASE: 10:00 A.M. AEST, TUESDAY, JULY 27, 2010

The Conference Board®
Australia Business Cycle Indicators<sup>SM</sup>

# THE CONFERENCE BOARD LEADING ECONOMIC INDEX® (LEI) FOR AUSTRALIA AND RELATED COMPOSITE ECONOMIC INDEXES FOR MAY 2010

**The Conference Board Leading Economic Index**<sup>®</sup> (LEI) for Australia increased 0.3 percent and **The Conference Board Coincident Economic Index**<sup>®</sup> (CEI) increased 0.2 percent in May.

- The Conference Board LEI for Australia increased again in May, and the strengths and weaknesses among the leading indicators were balanced this month. Despite the increase in May, the six-month growth rate in the leading economic index continued to moderate, to 1.7 percent (a 3.4 percent annual rate) between November 2009 and May 2010, down from 3.4 percent (a 6.8 percent annual rate) for the previous six months. Nonetheless, the strengths among the leading indicators have been slightly more widespread than the weaknesses over the past six months.
- The Conference Board CEI for Australia also increased in May, with all its components advancing. Retail trade picked up this month, after declining for three consecutive months. With May's small gain, the coincident economic index grew by 1.0 percent (a 1.9 percent annual rate) in the six-month period through May 2010, an improvement from the 0.1 percent decline (about a -0.2 percent annual rate) for the previous six months. At the same time, real GDP increased at a 2.0 percent annual rate in the first quarter of 2010, down from a 4.5 percent annual rate in the fourth quarter of 2009.
- The Conference Board LEI for Australia remains on a rising trend, which began in the middle of last year. However, its six-month growth rate has moderated in recent months. At the same time, The Conference Board CEI for Australia has continued to increase this year, and its sixmonth growth has been fairly stable. Taken together, the current behavior of the composite indexes suggests that the economic expansion is likely to continue, albeit at a modest pace in the near term.

<u>LEADING INDICATORS.</u> Five of the seven components in The Conference Board LEI for Australia increased in May. The positive contributors to the index — in order from the largest positive contributor to the smallest — are rural goods exports\*, the sales to inventories ratio\*, the yield spread, money supply\*, and gross operating surplus\*. Share prices and building approvals declined in May.

With the 0.3 percent increase in May, The Conference Board LEI for Australia now stands at 115.7 (2004=100). Based on revised data, this index increased 0.1 percent in April and increased 0.3 percent in March. During the six-month period through May, the leading economic index increased 1.7 percent, and four of the seven components increased (diffusion index, six-month span equals 57.1 percent).

## The next release is scheduled for August 26, 2010 at 10:00 A.M. (AEST) In the U.S. – August 25, 2010 at 8:00 P.M. (ET)

<u>COINCIDENT INDICATORS.</u> All four components in The Conference Board CEI for Australia increased in May. The increases - in order from the largest positive contributor to the smallest – occurred in employed persons, retail trade, household gross disposable income\*, and industrial production\*.

With the increase of 0.2 percent in May, The Conference Board CEI for Australia now stands at 115.1 (2004=100). Based on revised data, this index increased 0.1 percent in April and increased 0.2 percent in March. During the six-month period through May, the coincident economic index increased 1.0 percent, with three of the four components in the series making positive contributions (diffusion index, six-month span equals 75.0 percent).

### FOR TABLES AND CHARTS, SEE BELOW

<u>DATA AVAILABILITY.</u> The data series used to compute **The Conference Board Leading Economic Index**<sup>®</sup> (LEI) for Australia and **The Conference Board Coincident Economic Index**<sup>®</sup> (CEI) for Australia reported in this release are those available "as of" 10 A.M. ET on July 21,2010. Some series are estimated as noted below.

NOTES: Series in The Conference Board LEI for Australia that are based on our estimates are sales to inventory ratio and gross operating surplus for private non-financial corporations, the implicit price index used to deflate rural goods exports and building approvals, and the CPI used to deflate money supply M3. Series in The Conference Board CEI for Australia that are based on our estimates are industrial production and household disposable income. CPI was used to deflate retail trade.

Effective with the February 26, 2009 release, the seasonally adjusted retail trade data replaced the trend estimated series, the publication of which was suspended by the Australia Bureau of Statistics.

THE CYCLICAL INDICATOR APPROACH. The composite economic indexes are the key elements in an analytic system designed to signal peaks and troughs in the business cycle. The leading and coincident economic indexes are essentially composite averages of several individual leading or coincident indicators. (See page 3 for details.) They are constructed to summarize and reveal common turning point patterns in economic data in a clearer and more convincing manner than any individual component—primarily because they smooth out some of the volatility of individual components.

Historically, the cyclical turning points in The Conference Board LEI for Australia have occurred before those in aggregate economic activity, while the cyclical turning points in The Conference Board CEI for Australia have occurred at about the same time as those in aggregate economic activity.

Further explanations of the cyclical indicator approach and the composite economic index methodology appear in The Conference Board's *Business Cycle Indicators* report and Web site: http://www.conference-board.org/data/bci.cfm.

<sup>\*</sup> See notes under data availability.

### Australia Composite Economic Indexes: Components and Standardization Factors

Lea	ding Economic Index	<u>Factor</u>
1.	Yield Spread, 10 year minus Policy Rate	.1113
2.	Share Prices, All Ordinaries	.0398
3.	Money Supply, M3	.2274
4.	Rural Goods Exports	.0261
5.	Sales to Inventory Ratio	.4299
6.	Gross Operating Surplus, Private Non-Financial Corporations	.1140
7.	Building Approvals	.0515
Coi	ncident Economic Index	
1.	Retail Trade	.2591
2.	Industrial Production	.0941
3.	Employed Persons	.4386
4.	Household Disposable Income	.2082

#### Notes

The component factors are inversely related to the standard deviation of the month-to-month changes in each component. They are used to equalize the volatility of the contribution from each component and are "normalized" to sum to 1.

These factors were revised effective with the January 2010 release, and all historical values for the two composite economic indexes have been revised at the time to reflect the changes. (Under normal circumstances, updates to the leading and coincident economic indexes only incorporate revisions to data over the past six months.) The factors above were calculated using 1979 to 2008 as the sample period for measuring volatility for The Conference Board LEI for Australia, and 1982 to 2008 as the sample period for The Conference Board CEI for Australia. There are additional sample periods as the result of different starting dates for the component data. When one or more components are missing, the other factors are adjusted proportionately to ensure that the total continues to sum to 1. For additional information on the standardization factors and the index methodology visit our Web site: http://www.conference-board.org/data/bci.cfm.

The trend adjustment factor for The Conference Board LEI for Australia is -0.0605 calculated from 1960-1973, and -0.1194 calculated over the sample period 1974-2008.

To address the problem of lags in available data, those leading and coincident indicators that are not available at the time of publication are estimated using statistical imputation. An autoregressive model is used to estimate each component. The resulting indexes are constructed using real and estimated data, and will be revised as the data unavailable at the time of publication become available. Such revisions are part of the monthly data revisions, now a regular part of the U.S. Business Cycle Indicators program. The main advantage of this procedure is to utilize in the leading economic index the data, such as stock prices, that are available sooner than other data on "real" aspects of the economy, such as new orders and changes in inventory. Empirical research by The Conference Board suggests there are real gains in adopting this procedure to make all the indicator series as up-to-date as possible.

### **NOTICES**

The schedule for "The Conference Board Leading Economic Index® (LEI) for Australia" news release for 2010 is:

June 2010 Data

July 2010 Data

August 2010 Data

August 2010 Data

Wednesday, August 25, 2010

Tuesday, September 28, 2010

Wednesday, October 27, 2010

September 2010 Data

October 2010 Data

Monday, December 20, 2010

All releases are at 8:00 PM EST (10:00 A M AEDST the next day).

### ABOUT THE CONFERENCE BOARD

The Conference Board is a global, independent business membership and research association working in the public interest. Our mission is unique: to provide the world's leading organizations with the practical knowledge they need to improve their performance and better serve society. The Conference Board is a non-advocacy, not-for-profit entity holding 501 (c) (3) tax-exempt status in the U.S. For additional information about The Conference Board and how it can meet your needs, visit our website at <a href="www.conference-board.org">www.conference-board.org</a>.
